Cleaning of Acrylic Glass

(For the following activities we do not assume any kind of responsibility)

Cleaning

The best way to remove dust or insects from acrylic glass is to wash the surface with plenty of water to which a dash of washing up liquid was added. By no means you should use glass cleaning or similar products that contain vinegar. More resistant dirt, such as insects sticking to the surface should be soaked using a wet, soft cloth or even a tissue. After a while you should wash it off with a mixture of water and washing-up liquid. Always finish by rinsing with plenty of clear water. It is absolutely vital to use a new, clean and soft cloth or sponge to wash the glazing.

Werra-Clean

Spread a thin layer of WERRA-CLEAN on the acrylic surface (pumping sprayer) and rub in slightly with a micro fibre cloth. Wait a short while (5 to 15 seconds) to let the spray take effect and afterwards wipe the surface completely dry in circles using a micro fibre cloth. This treatment produces a water-repellent effect that avoids the building of water marks for a certain period of time. A noticeably smoother surface is produced.

All the necessary cleaning products are available from our shop.
