Cleaning a Polycarbonate Windscreen

(For the below mentioned activities we do not assume any kind of responsibility!)

Cleaning

Polycarbonate windscreens that are dusty or covered with insects can most effectively and gently be cleaned using plenty of water and a little washing-up liquid. By no means you should use glass cleaning or similar products that contain vinegar. More resistant dirt, such as insects sticking to the surface should be soaked using a wet, soft cloth or even a tissue. After a while you should wash it off with a mixture of water and washing-up liquid. Always finish by rinsing with plenty of clear water. It is absolutely vital to use a new, clean and soft cloth or sponge to wash the glazing.

WERRA-CLEAN

To finish off, you treat the windscreen with the antistatic cleaner "WERRA-CLEAN". Spread a thin layer of WERRA-CLEAN on the screen (pumping sprayer) and rub in slightly with a micro fibre cloth. Let it work in for a short while (5 to 15 seconds) and afterwards wipe it completely dry in circles using a micro fibre cloth. This treatment produces a water-repellent effect that avoids the building of water marks for a certain period of time. A noticeably smoother surface is produced.

All the cleaning products can be supplied by us.
